

# MEGAFLEX

Control Your World

"Companies shrink and grow, people and needs change all the time. Seamless movement is a cornerstone of business. Systems must be able to serve people and help their movement. Megaflex wants to enable the easier management of differing movements."

# Megaflex – Control Your World

---

“Existing systems show customers how to work or how to create their organisation. With us, the customer tells us how we should make Visma Megaflex work. We can provide services that adapt and scale according to our customers’ needs.”

Visma Megaflex has changed the world by introducing an entirely new software solution

to the market. We provide innovations that facilitate movement and property management. Our solution has such a high level of security that we are able to concentrate on streamlining access and its management instead of just applying restrictions.

## **Comprehensive product and service solutions**

Our software solution is called Megaflex. Megaflex is a modern service solution which is used to control the flow of people in buildings. The service has software modules ranging from access control to work time management and visitor management to room reservation. All software modules can be found in the same browser-based interface. Megaflex is a modern, flexible and cost-effective solution that replaces traditional, heavy access control systems.

“We make certain to provide an effective service by combining expertise and the will to serve our customer with the right products and an understanding of the customer’s needs.”

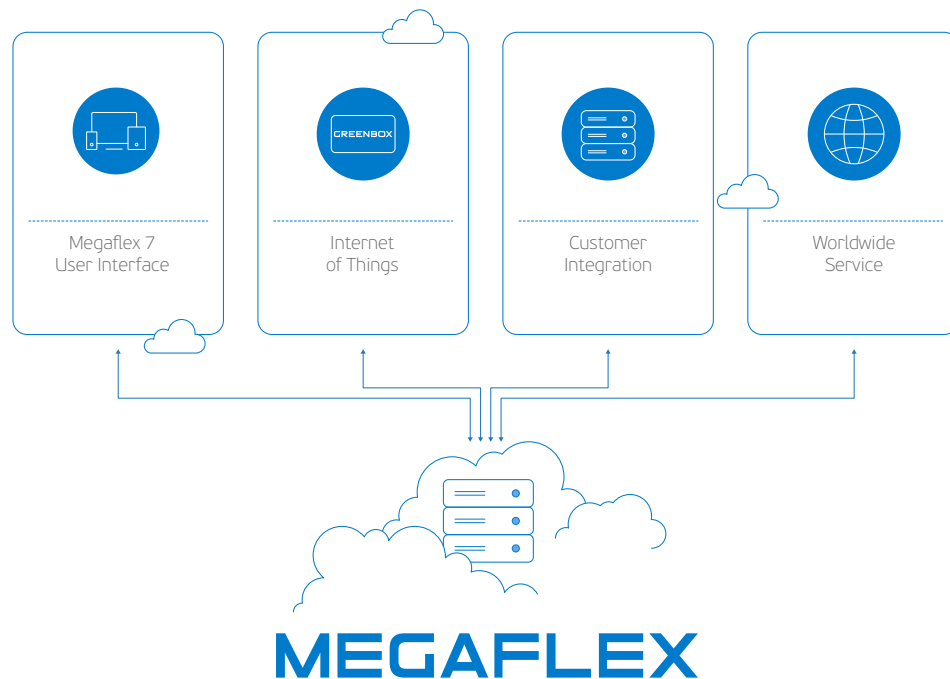

**Juha Saari**

CEO — Visma Megaflex Oy

Visma Megaflex Oy and our partners employ hundreds of the industry’s best professionals.

We have built demanding systems on a global scale and we are always ready to modify our products to further benefit our clients’ needs and wishes.

# SaaS—Software as a Service, a comprehensive solution

Megaflex is an all-new Software as a Service, or SaaS, solution. What this means is that the software is provided as a cloud service without the need for extensive investment on equipment. Megaflex is designed to replace the traditional and cumbersome access control systems.

## Single user interface

Our software solution can be deployed quickly, as it is operated through a browser-based user interface. This makes the system possible to be used on mobile devices, independent of time and place. The interface allows you to control the movement of people and the use of rooms with flexibility and efficiency, in real time.

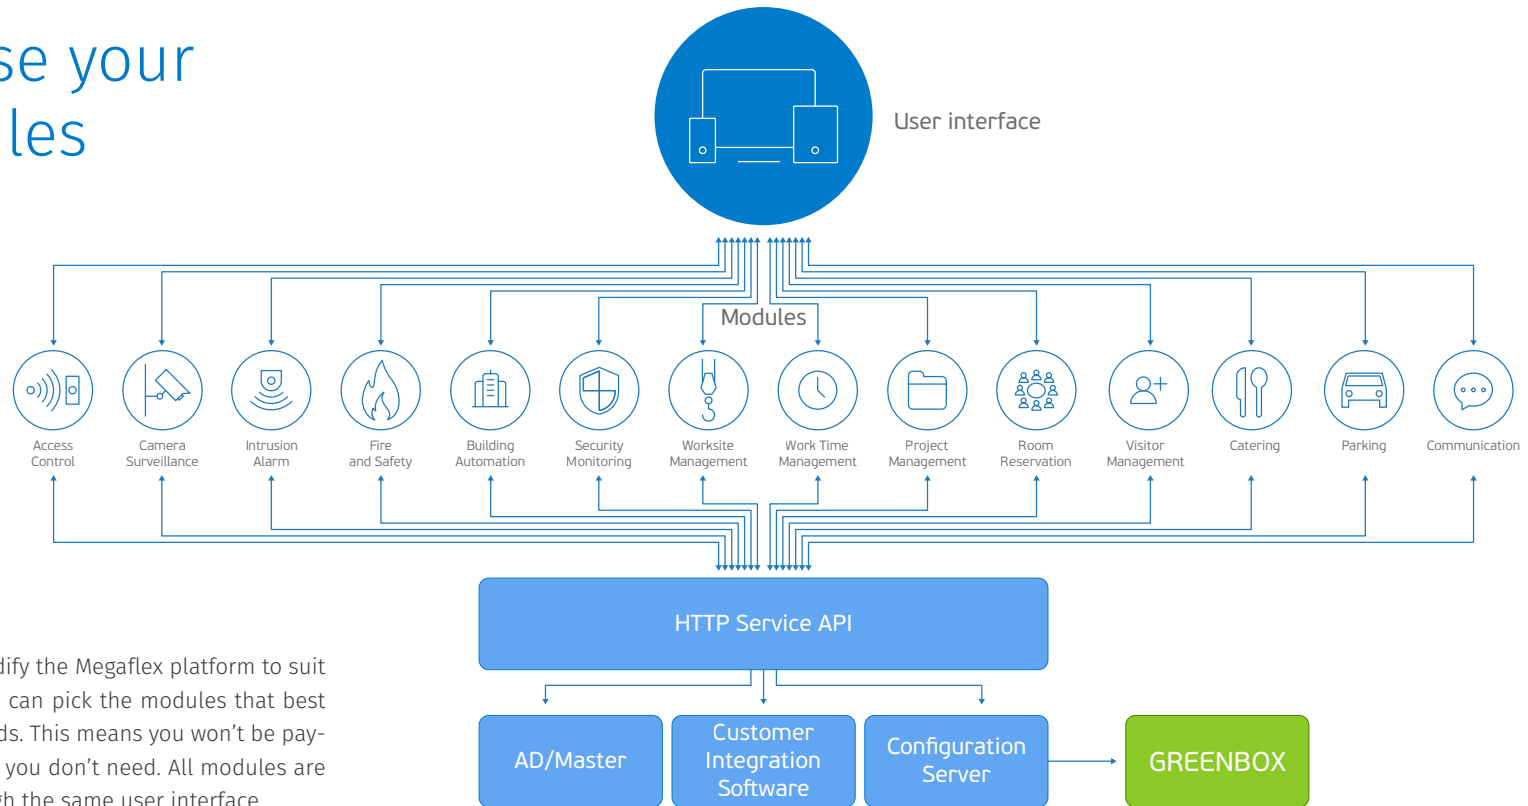

## Software integration

Thanks to its new network structure, Megaflex is easy to integrate into complex environments. Integration is a daily task for us – we make it quick and effortless. Integrating various existing systems is both efficient and time-saving. Easy integration and our advanced user interface guarantee that your working environment will become more efficient.

## Service to suit your business

It is easy to create easy-to-manage global environments in the user interface without reaching capacity limits. Megaflex allows the management of properties from large portfolios to single locations. Real-time maintenance is possible remotely, all the way to the details. And thanks to annual service updates, the solution is guaranteed to remain flexible in the future.

# Choose your modules

It is easy to modify the Megaflex platform to suit your needs. You can pick the modules that best match your needs. This means you won't be paying for anything you don't need. All modules are available through the same user interface.

# Megaflex user interface

The service is easily scalable up to global coverage – one interface will put the world at your fingertips.

To use Megaflex services, all you need is a browser with a network connection – we offer all our services in the flexible SaaS format (Software as a Service) instead of the traditional licence-based format. Maintaining and expanding Megaflex is flexible and inexpensive.

An unlimited number of properties, doors and personnel can be managed using the user interface, avoiding per-property server and maintenance costs. The availability and maintenance of the server are part of the Megaflex service package.

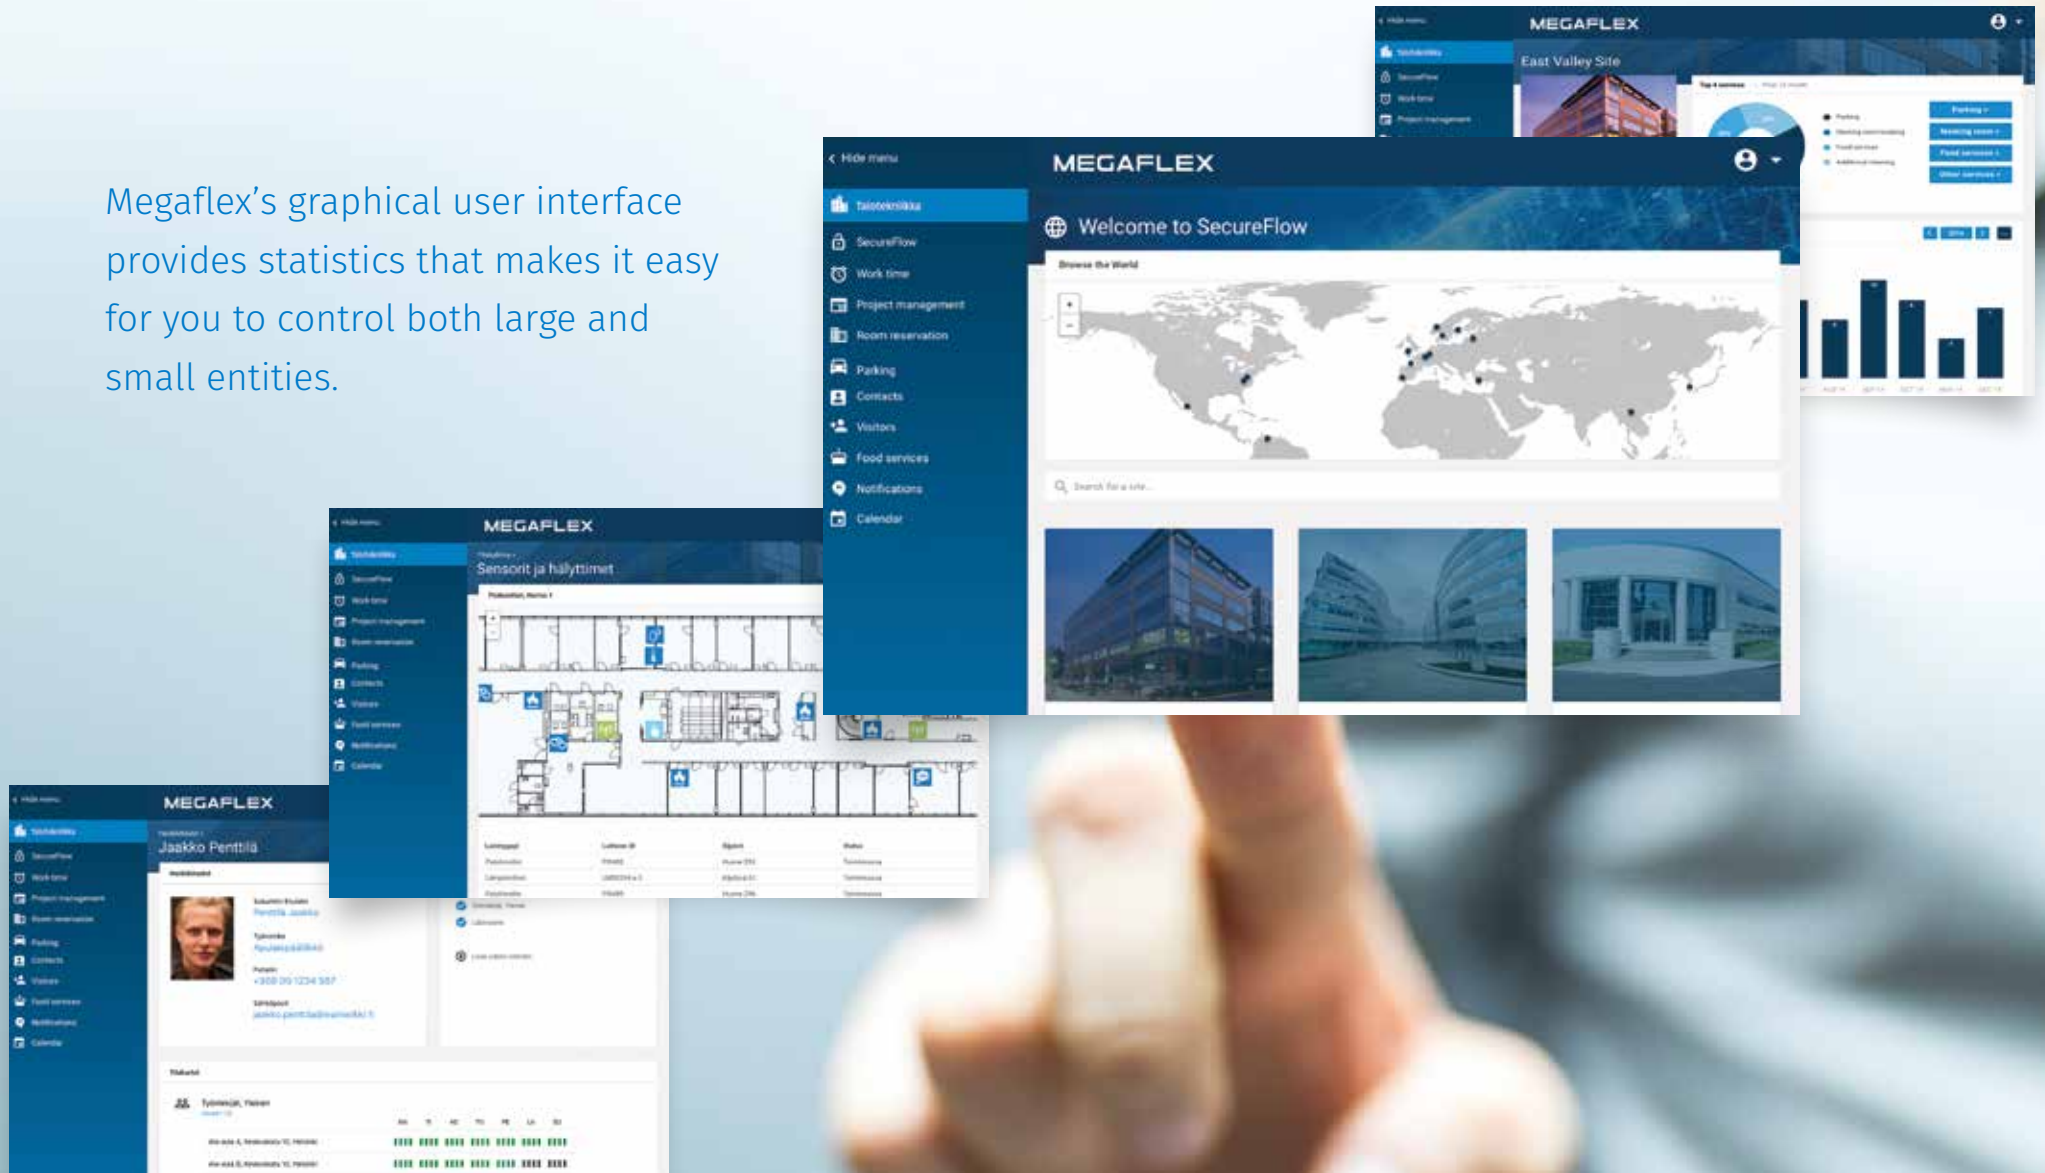

## High level of security

Megaflex is also the most secure way to guide the movement of people and room use. The solution's high level of information security is based on banking grade SSH/AES encryption and a reliable server farm. Compared to the traditional model of convoluted and technically closed systems, Megaflex has a significantly higher level of security.

## Defining access rights

Our user interface is easy to use. It provides statistics that makes all packages, both large and small, easy to manage. Access rights can be set on the user level, which means you get to choose the functions that are available for every user.

Megaflex's graphical user interface provides statistics that makes it easy for you to control both large and small entities.

# Megaflex - Greenbox

Greenbox is an industrial internet-based versatile product developed by Visma Megaflex that is flexible to program. One device can control multiple electronic components, such as locks, readers, burglar alarms or any other sensor, all the way to air quality

measurement. Greenboxes are controlled with the Megaflex user interface – you get the power to control at your fingertips.

## Cost-effective solution

Greenbox is a cost-effective solution. Expensive, hard to maintain systems can be

replaced with one, modern device.

Greenbox devices are easy to install, troubleshoot and maintain, and remote access is also possible. The Megaflex service includes warranty, maintenance and repairs for the devices. You won't have to sign an expensive service contract.

Greenbox is a solution that will bring your company to the present.

## Simplicity and flexibility through IP technology

Modern processor technology, versatile inputs and wireless features (Wi-Fi/LAN/4G) make it easy to connect electronic components to a Greenbox device. Remote control makes updates and diagnostics flexible and all connections are behind the bank-level security of the HTTPS protocol. Offline mode has logging capacity for over twelve million events. Greenbox is, therefore, guaranteed to function even during possible network disruptions.

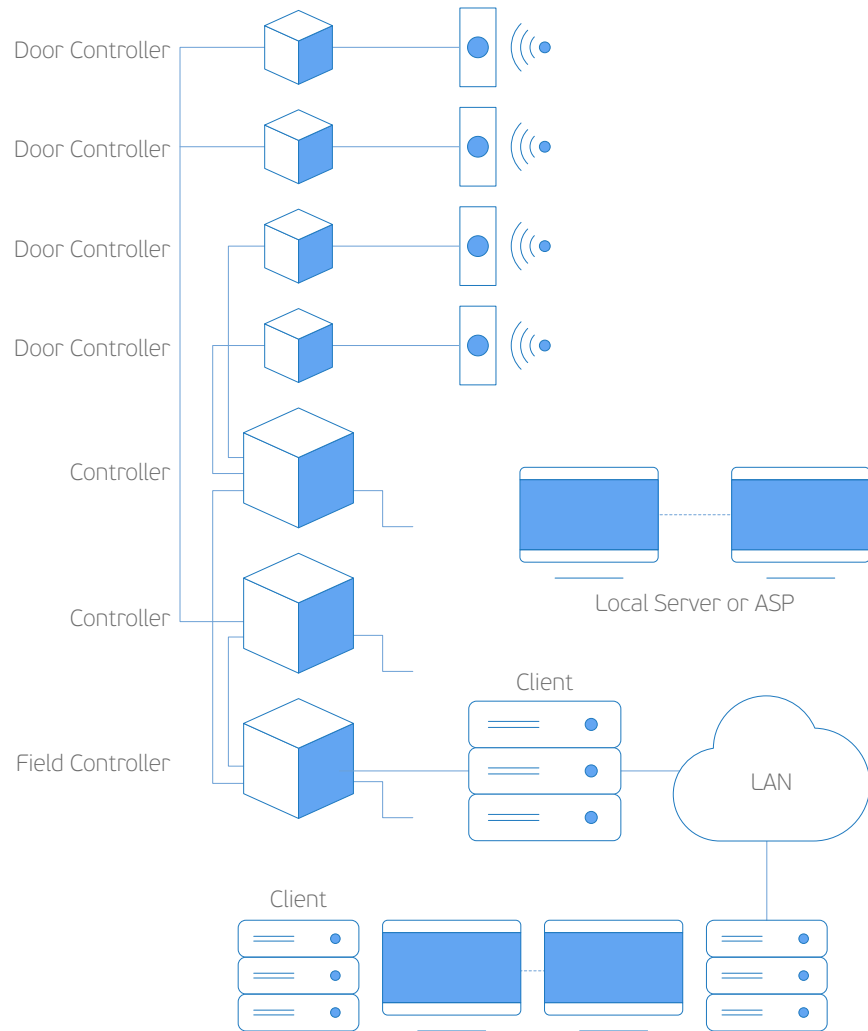

## Replacing existing systems

Megaflex updates your old, inflexible systems to today's standards by making them easier to manage. Greenbox devices are easy to attach to a company's existing systems. You can make use of your existing cabling, readers and tags, as Greenbox devices are easy to connect to them. It is surprisingly easy to move from old systems to the Megaflex system.

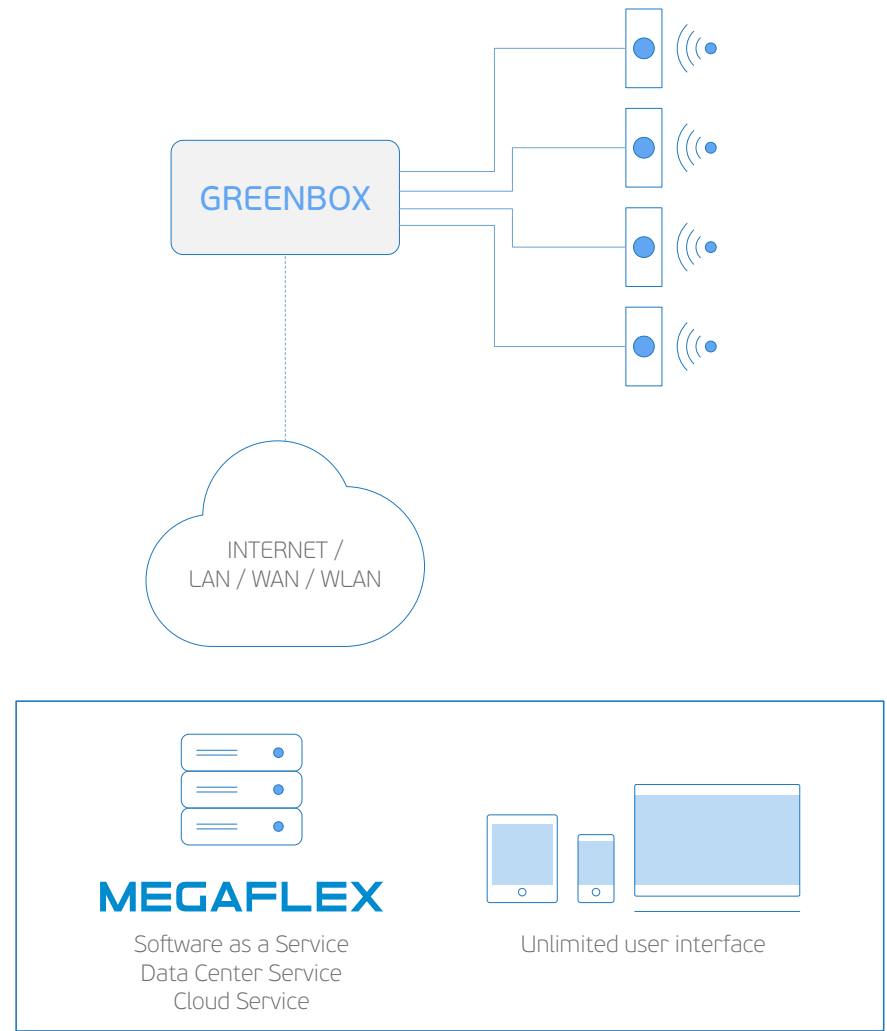

Megaflex was created to replace all convoluted and closed access control systems that exist today. Building a functional and user-friendly system has never been this easy.

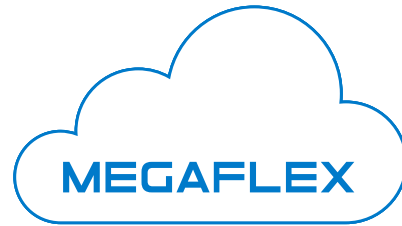

## Old systems

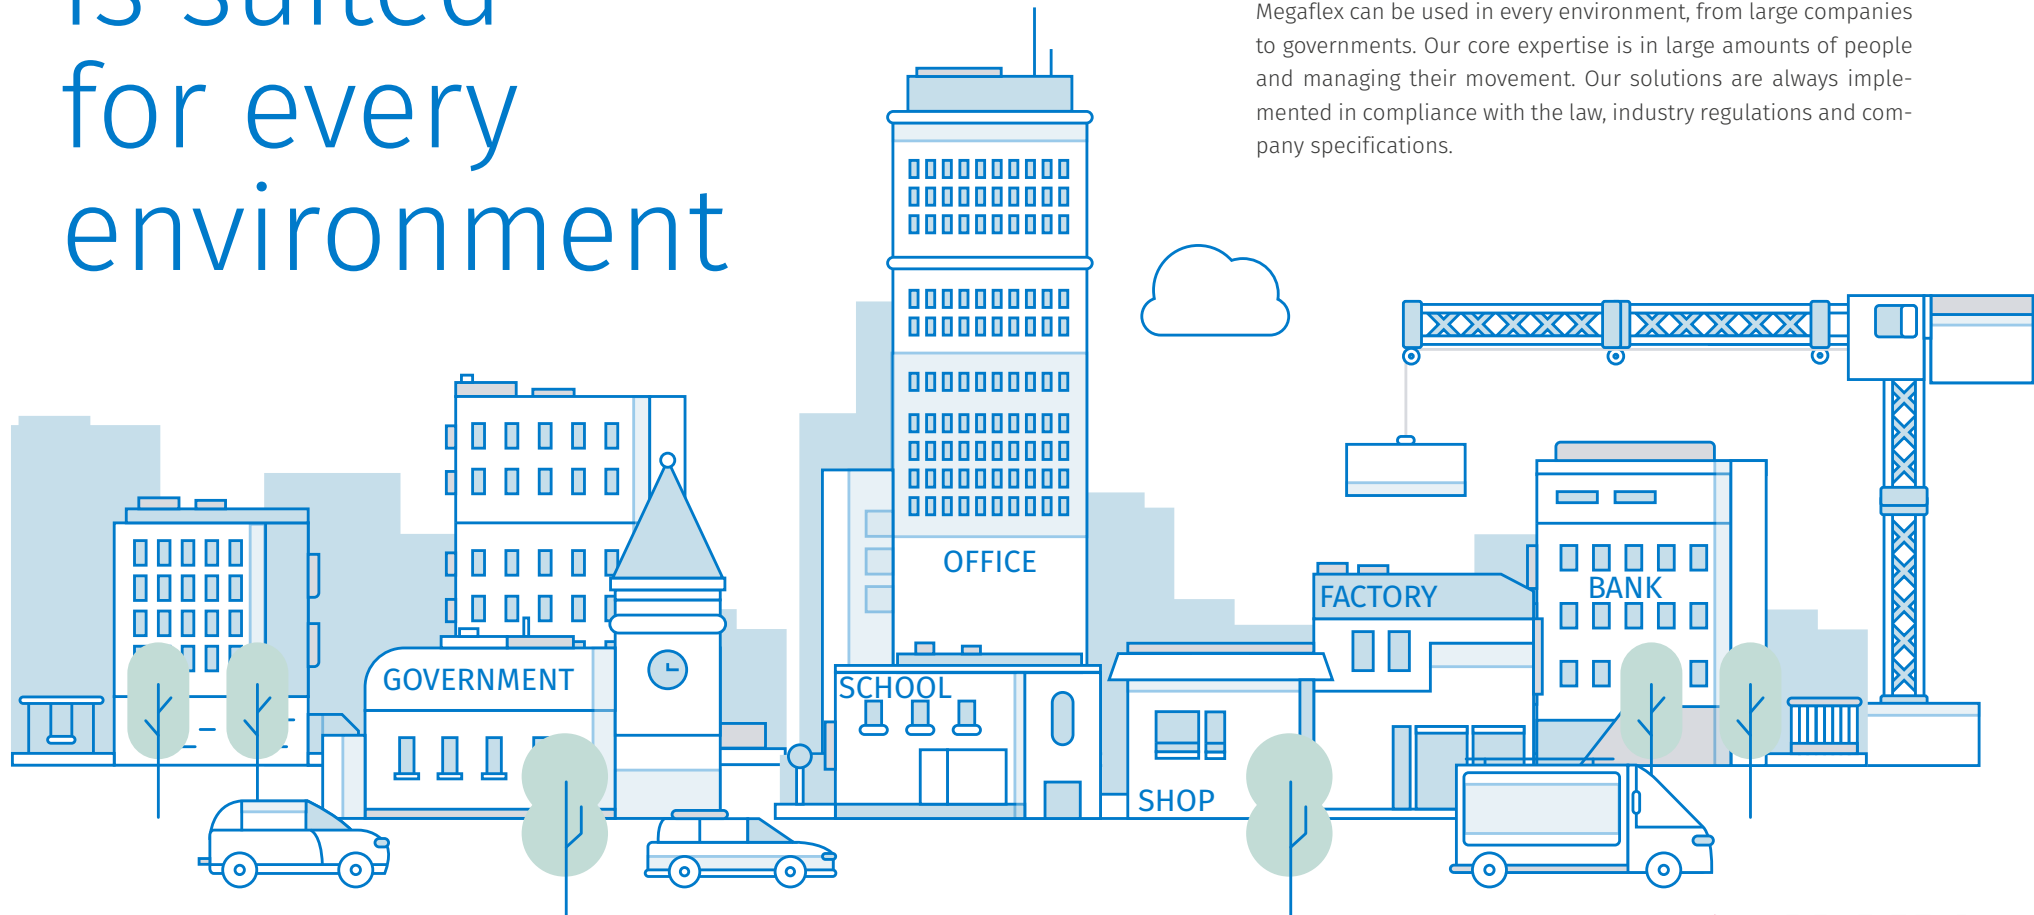

## MEGAFLEX

# Megaflex is suited for every environment

Megaflex can be used in every environment, from large companies to governments. Our core expertise is in large amounts of people and managing their movement. Our solutions are always implemented in compliance with the law, industry regulations and company specifications.
